

V 1.35

PKMN VORE MOD DOC

Mod by Tsunombe

Guide editing by
Yataro_Ibuza

CREDITS

Essentials Vore Plugin. Programming by Tsunombe, Example Preds art from Allithemeal and Parkijiolo

Special thanks to Rayquazanothere for helping me test and Yataro_Ibuza for helping format the guide.

Notes: currently not actually a plugin. For now, this will override your script file.

Optional Dependencies

None of these are necessary to running the game, but are encouraged

1. Following Pokémon EX
2. Generation 9 Pack
3. Minimized UI – included in mod
4. Mod now supports mid battle dialogue with the following triggers with Deluxe Battle kit plugin. Are additional keywords that can be used. Opponent and player activates on their side's respective pokemon, pokemon devoured/digested activates for either side.

"PokemonDevoured"

"PlayerDevoured"

"OpponentDevoured"

"PokemonDigested"

"PlayerDigested"

"OpponentDigested"

If using gen 9 plugin, go to settings and set restore items to false. Prevents a crash where the plugin tries to return items to eggs, and fixes a bug where pokemon would have their items burped up on digestion but be given the item back by the pack, duplicating them

Installation

WHEN RUNNING IN PLAYTEST MODE WAIT FOR THE CONSOLE AND GAME WINDOWS TO POP UP, THEN HOLD CONTROL. THIS WILL MAKE SURE THAT CHANGED FILES GET COMPILED.

This is not a plugin. You will need to pick and choose what elements you will like to use for your game. This also isn't intended to be used with pre-existing games, since you will need to update the trainers and encounters to use Predmons manually. It is MANDATORY that you replace the Scripts.rxdta file located in the Data file with the one

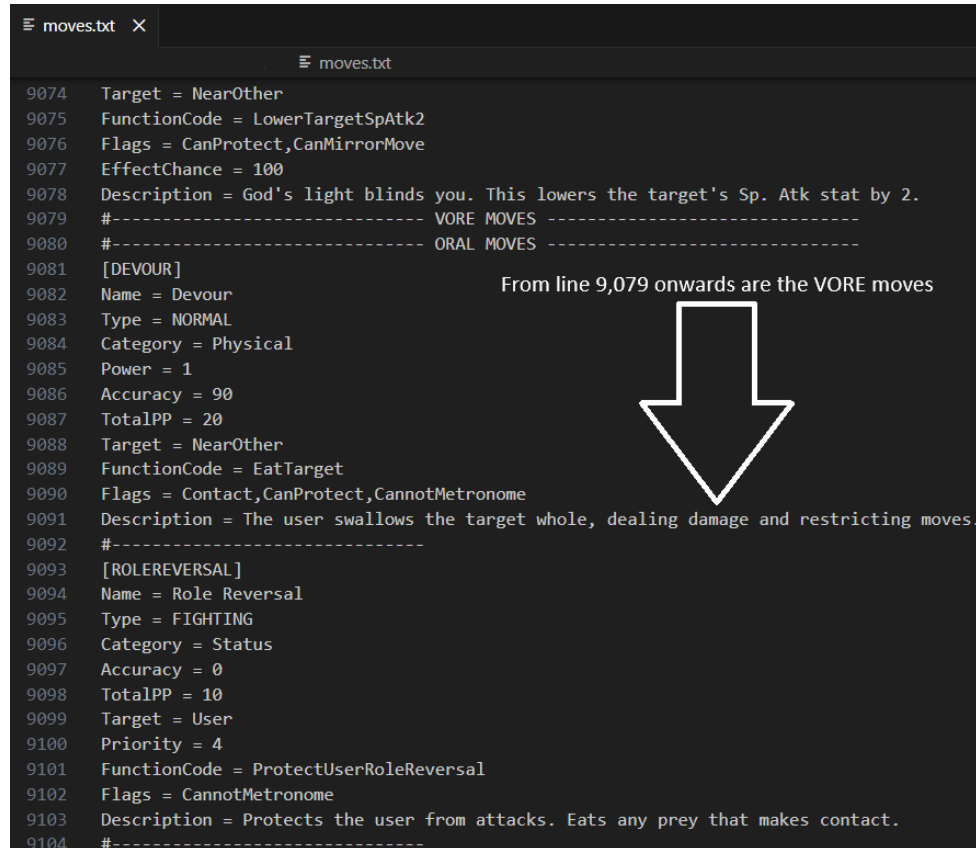

in this mod for the mod to work., Similarly, you will need to make sure that the moves, ribbons, and abilities I provide are copy and pasted to the ends of the respective text files in the PBS folder. Lastly, add the Vore_scenes.txt to PBS and install the minimized_ui plugin that comes with the mod. It was created by the spriter Parkijiolo with the purpose of marking what pokemon are preds in battle with a special icon, and takes up less space as to not cover the sprites with health bars.

ADD YOUR OWN PREDS

Adding Pokémon

To Add Vore to a Pokémon you need to:

1. Copy the original pokemon's information and paste it at the end of the Pokemon.txt with the ID changed from POKEMONNAME to VOREPOKEMONNAME
2. Assign "Pred" and "numofvorestages" flags to the Pokémon.
3. Assign them multiple forms in "pokemonforms.txt"
4. Assign them Vore moves from "moves.txt" (see Figure 1) to either "Moves =" (if they learn it by leveling up) or "TutorMoves =" (if they must learn it from a Tutor, TM, or HM).

```
9074 Target = NearOther
9075 FunctionCode = LowerTargetSpAtk2
9076 Flags = CanProtect,CanMirrorMove
9077 EffectChance = 100
9078 Description = God's light blinds you. This lowers the target's Sp. Atk stat by 2.
9079 #----- VORE MOVES -----
9080 #----- ORAL MOVES -----
9081 [DEVOUR]
9082 Name = Devour
9083 Type = NORMAL
9084 Category = Physical
9085 Power = 1
9086 Accuracy = 90
9087 TotalPP = 20
9088 Target = NearOther
9089 FunctionCode = EatTarget
9090 Flags = Contact,CanProtect,CannotMetronome
9091 Description = The user swallows the target whole, dealing damage and restricting moves.
9092 #-----
9093 [ROLEREVERSAL]
9094 Name = Role Reversal
9095 Type = FIGHTING
9096 Category = Status
9097 Accuracy = 0
9098 TotalPP = 10
9099 Target = User
9100 Priority = 4
9101 FunctionCode = ProtectUserRoleReversal
9102 Flags = CannotMetronome
9103 Description = Protects the user from attacks. Eats any prey that makes contact.
9104 #-----
```

From line 9,079 onwards are the VORE moves

Figure 1. Moves.txt in PBS folder

For Art, all Pokémon art is done at 96x96 then scaled up. Front facing sprites are scaled by 2x, while the back sprites are scaled by 3x

If you would like the Pokémon in-game to be preds, you will need to **give them the Pred flag** and the **number of weight stages** the pred will have. A weight stage consisting of each sprite made for the Pokémon; not including the starting sprite.

If your Pokémon has multiple forms; like Meloetta, include the number of forms the Pokémon will have in the **NumOfForms flag** (see Figure 2). You do not need to do this for gendered forms; they have their own rules on how to implement. If you have multiple forms, each form will need the same amount of Vore stages. This includes Pokémon with Megas. However, you only need to include the number of Vore stages that one of its forms will use.

```
#-----  
[DEVOURETTA]  
[...] //Removed for clarity  
Flags = NumOfVoreStages_13,Pred,NumOfForms_2  
WildItemCommon = STARPIECE  
WildItemUncommon = STARPIECE  
WildItemRare = STARPIECE  
#-----
```

Figure 2. Example of NumOfForms

In the above example, we have a Meloetta with a Pirouette and Aria form. Each form has 13 stages, with 26 in total plus the starting aria and pirouette form that are counted as form 0.

Additional flags

1. Inedible – can't be eaten in combat.
2. NoPerma – can't be permanently deleted by perma even on the perma mode.
3. MassVore – only goes up 1 weight gain stage at a time no matter what. Alternate dialogue on digestion.
4. Player – gains access to “player is a pred” options

If you want to make a new Pokémon, you will need to add them in yourself, following the format listed above and the format listed in the Pokémon essentials wiki. It is also necessary to remake Pokémon if you do not wish to use some of its existing forms or Megas with the Vore mod.

The next step is to add your forms to “pokemon_forms.txt,” for the most part they do not really need to do much or even describe anything. You do have the

```
#-----  
[VORETEST,1]  
FormName = Stuffed Form  
BaseStats = 68,65,65,40,125,115  
#-----
```

option of modifying base stats, so it is a potential idea to make a Pokémon heavier but tankier as they gain weight (see Figure 3).

The number of forms you will need depends on the number of weight stages you make (see Figure 4).

```
#-----  
[VORETEST,2]  
FormName = Weight Gain Empty Form  
BaseStats = 68,65,75,80,125,115  
#-----  
[VORETEST,3]  
FormName = Weight Gain Empty Form  
BaseStats = 68,65,75,40,125,115  
#-----  
  
[...]  
AND SO ON UNTIL ALL WEIGHT  
STAGES ARE FULFILLED
```

Figure 4: Example of multiple forms (Simplified)

These will start at the first sprite of your Pokémon with a full stomach, then alternate between empty and full stomach sprite until you end with the last sprite of a Pokémon with a full stomach (see Figure 5). The reason you do it this way is, so a Pokémon will not visually lose weight on digesting a Pokémon.

How all the forms will look in the files. You can look at Pokémon Essentials wiki for what you can change between forms.

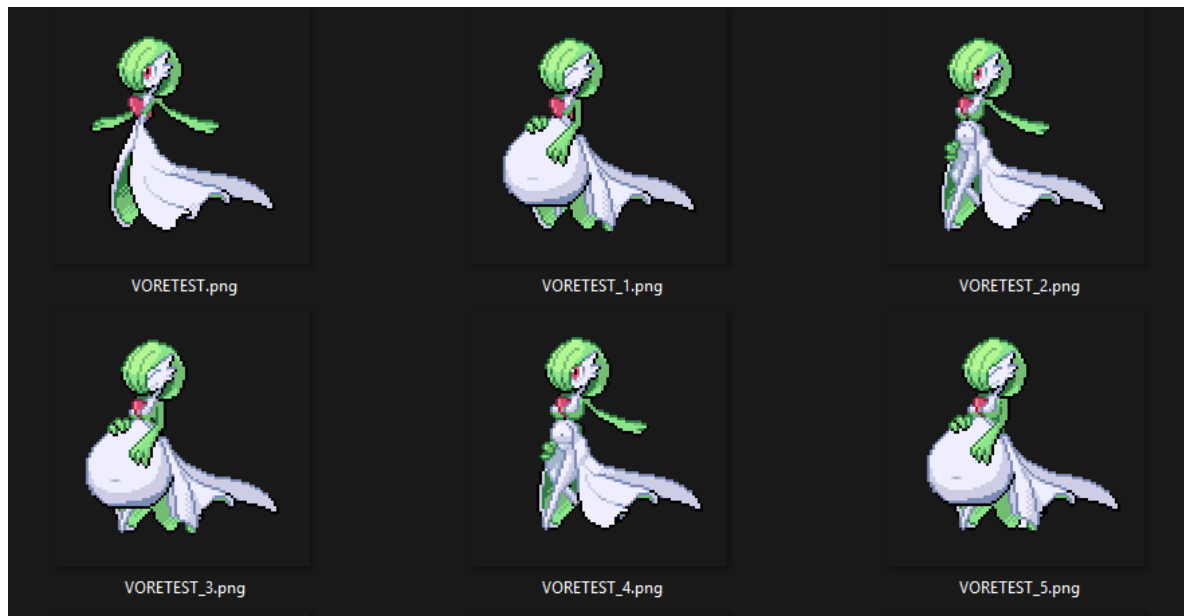

Figure 5. Sprite samples for VORETEST

For all these reasons I have made the Pokémon as Fakemon under a new name. I **STRONGLY** encourage making the pred as a new Pokémon with the name **VOREPOKEMONNAME**. This will:

1. Allow you to bypass things like Megas or alt forms you might not have sprites for.
2. Let the preds be at the bottom of the Pokémon list in debug mode.

If you do it this way, copy/paste the old Pokémon's information from the "pokemon.txt" folder with the new pred name and make its pre-evolutions evolution route go to the new pred Pokémon.

For example, if you want to add the Vore version of Scolipede:

1. You must create a new Pokémon called VORESCOLIPED.
2. Then, for Whirlipede to evolve to its vore version, you just need to add/replace SCOLIPED for VORESCOLIPED. See Figure 6 for follow-up example.

```
#-----  
[WHIRLPEDE]  
[...] //Removed for clarity  
Evolutions = VORESCOLIPED,Level,30 (2)  
#-----  
[VORESCOLIPED] (1)  
Name = Scolipede  
Types = BUG,POISON  
BaseStats = 60,100,89,112,55,69  
GenderRatio = AlwaysFemale  
//Add more details for PKMN
```

Figure 6. Example to create VORESCOLIPED.

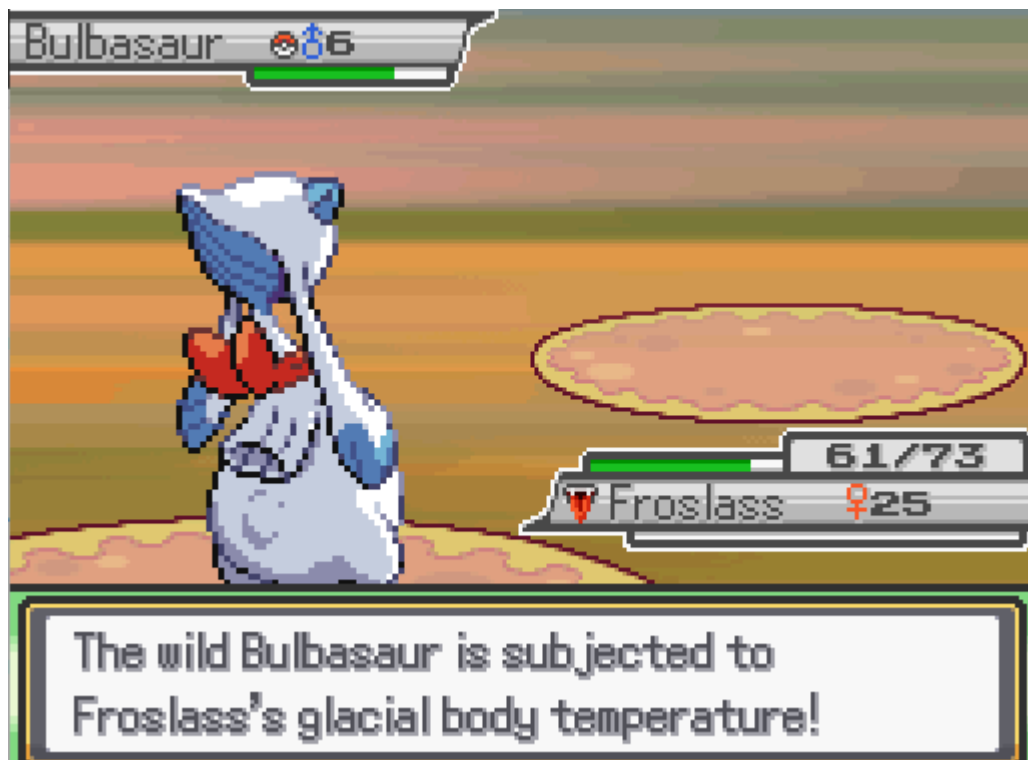

Once you have the Pokémon's form number decided, you can drop the Pokémon's sprites into their corresponding Front and Back folder located in the game's Graphics/Pokémon Folder.

IF YOU'RE USING A POKEMON WHO ALREADY HAS FORMS (Mimikyu, Arceus, etc.) YOU WILL NEED TO CODE THEIR FORMS TO WORK WITH THE VORE SYSTEM YOURSELF.

Abilities

I have created a set of abilities that interact with the system. Examples include gaining traits while digesting, gaining weight from eating moves, gaining stats from digesting prey, and much more. They are not necessary at all for the Pokémon to vore, but they are fun enough to include.

For more information of all the abilities available go to “[ALL VORE ABILITIES](#)”

Moves

The only way for a predator to eat a prey is through using a move with the EatTarget function code (see Figure 7).

Currently I have the move devour as a 1 Damage Physical move, because status moves typically ignore immunities which I find less interesting. I highly recommend making different variations of this move to add flavor to each pred (see Figure 8 for example).

```
[DEVOUR]
Name = Devour
Type = NORMAL
Category = Physical
Power = 1
Accuracy = 90
TotalPP = 20
Target = NearOther
FunctionCode = EatTarget
Flags = [...]
Description = Eats target.
```

Figure 7. Example of a Vore Move with "EatTarget"

```
[BELLYPORT]
Name = Bellyport
Type = PSYCHIC
Category = Status
Accuracy = 0
TotalPP = 20
Target = NearOther
FunctionCode = EatTarget
Flags = [...]
Description = TP target into stomach.
```

Figure 8. Example of another Vore Move using "EatTarget."

Keep in mind that each move can only have a single function code, so anything too advanced will need to be coded in yourself.

If you go to "EatTargetLogic" in scripts; from RPG Maker XP project, you can find where the logic for eating a prey is stored.

Most of this you probably should not touch unless you know what you are doing, but the one thing you can easily change is the display message when the move is used.

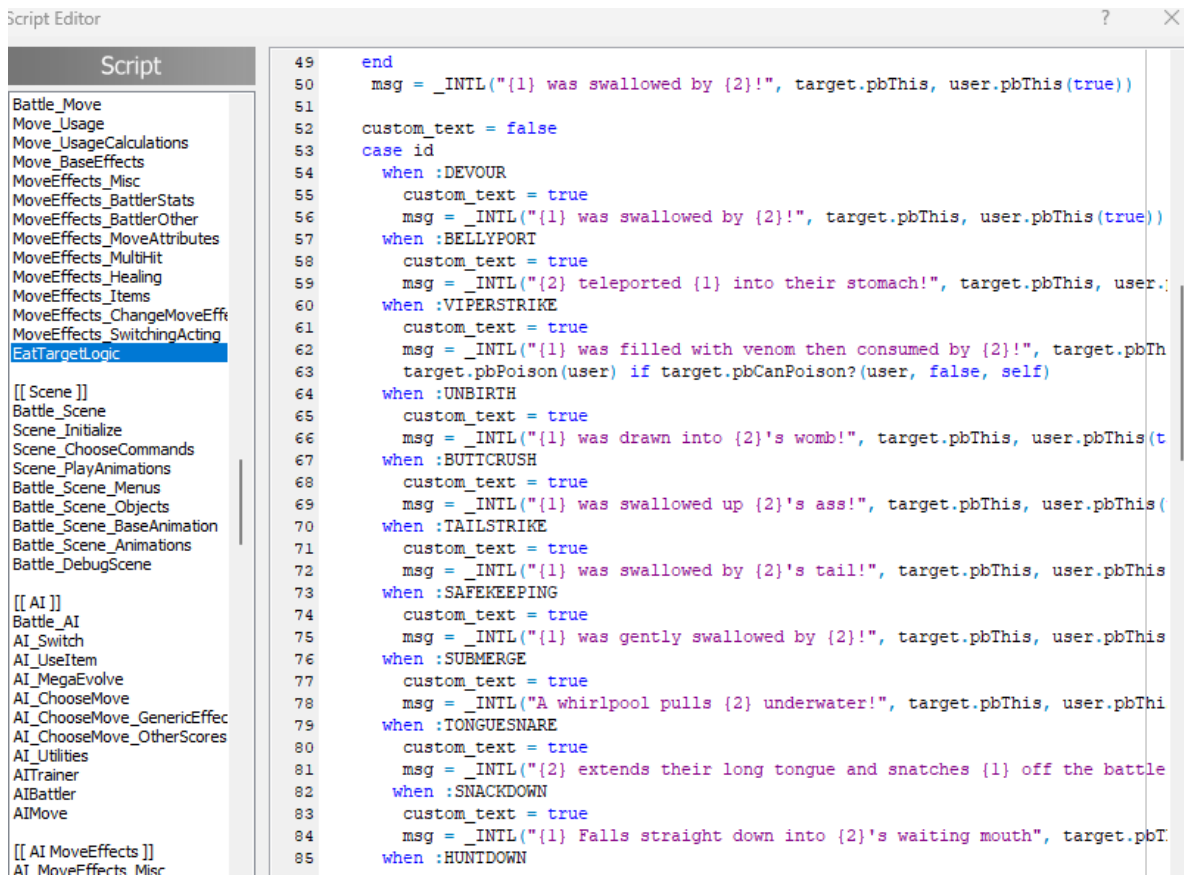

If you insert with the format of

when :YOURMOVENAMEALLCAPS

```
Msg = _INTL("{1} says your message to {2}",
target.pbthis, user.pbthis(true))
```

{1} and {2} correspond to the prey and the pred respectively (see Figure 9).

Figure 9. Vore Dialogues in "EatTargetLogic" function

In “MoveEffects_SwitchingAction” you can find where most of the EatTarget function codes are stored. They usually call the EatTargetLogic section from here and it is

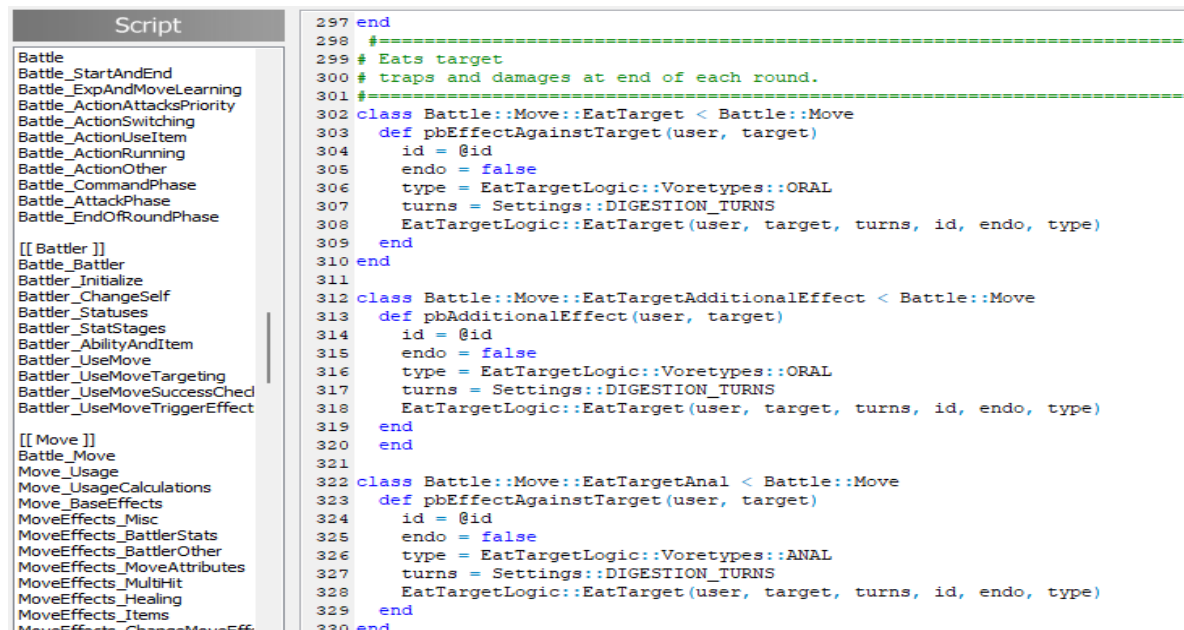

Figure 10. “MoveEffects_SwitchingAction” Display

where you can manually set the move id, if it is an endo move, vore type, and max number of turns (see Figure 10).

The other half of the code is in Battle_EndOfRoundPhase (see Figure 11)

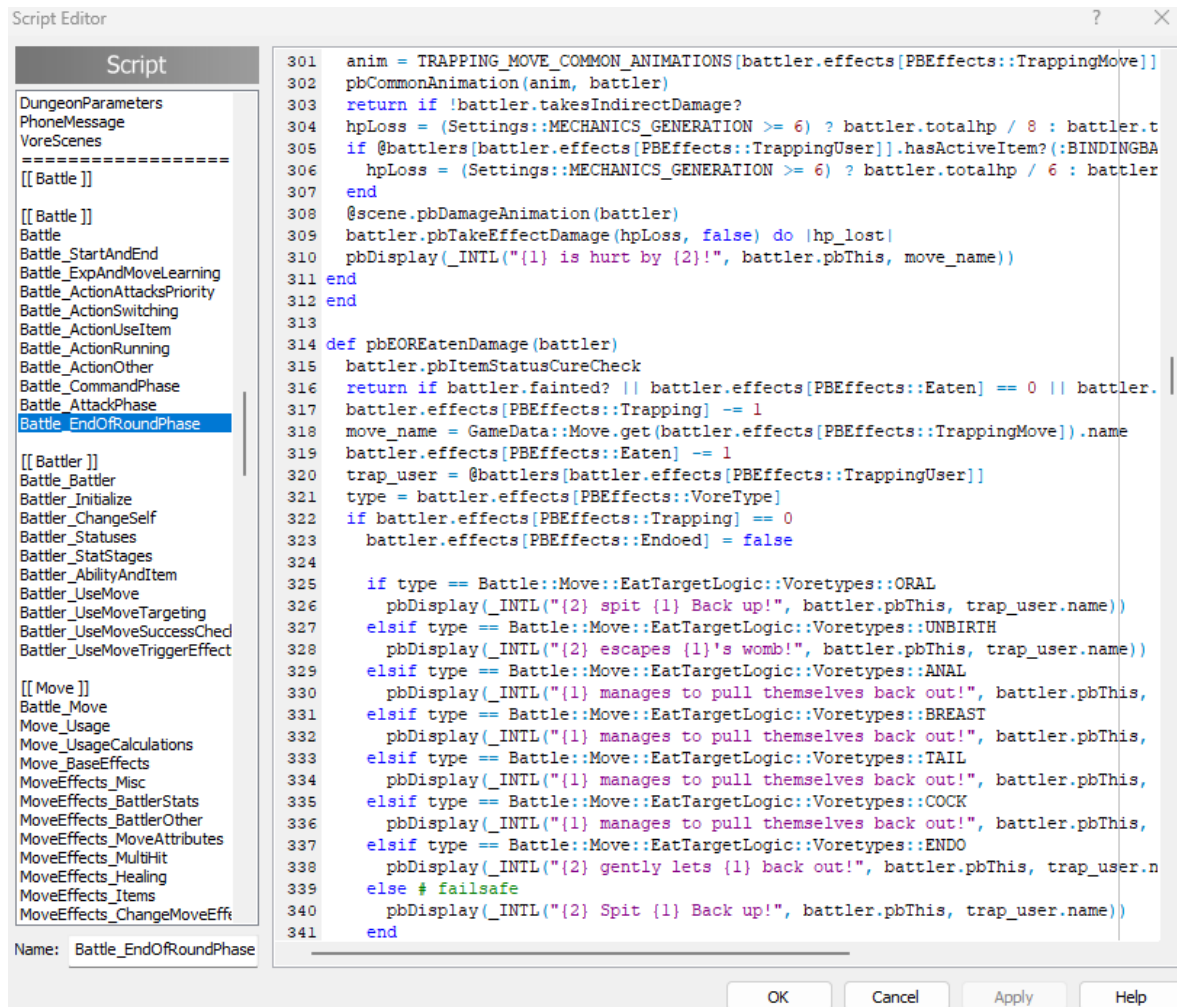

Figure 11. "Battle_EndOfRoundPhase" Script

Adding New Forms

Incredibly easy:

Add NumOfForms_x where x is the number of forms the Pokémon will need to switch between Pokémon with only their baseform + devour will not need this line added (see Figure 12).

```
[DEVOURETTA]
Name = Meloetta
FormName = Hungry Form
// Removed for Clarity
Flags = NumOfVoreStages_13,Intermediate_Weight_Gain,Pred,NumOfForms_2
WildItemCommon = STARPIECE
WildItemUncommon = STARPIECE
WildItemRare = STARPIECE
```

Figure 12. Example of DEVOURETTA with "NumOfForms_x"

Rules of the form system

There must be an equal number of sprites between the forms, and they must hit the limit that you set in the weight gain flag. With Meloetta at 2 Forms with 14 Images per form, which will be 28 images total. All forms must be added to the “forms.txt.”

Then, add your sprites in following an alternating order like so.

AiHere I have Aria form on evens and Pirouette on Odds (see Figure 13):

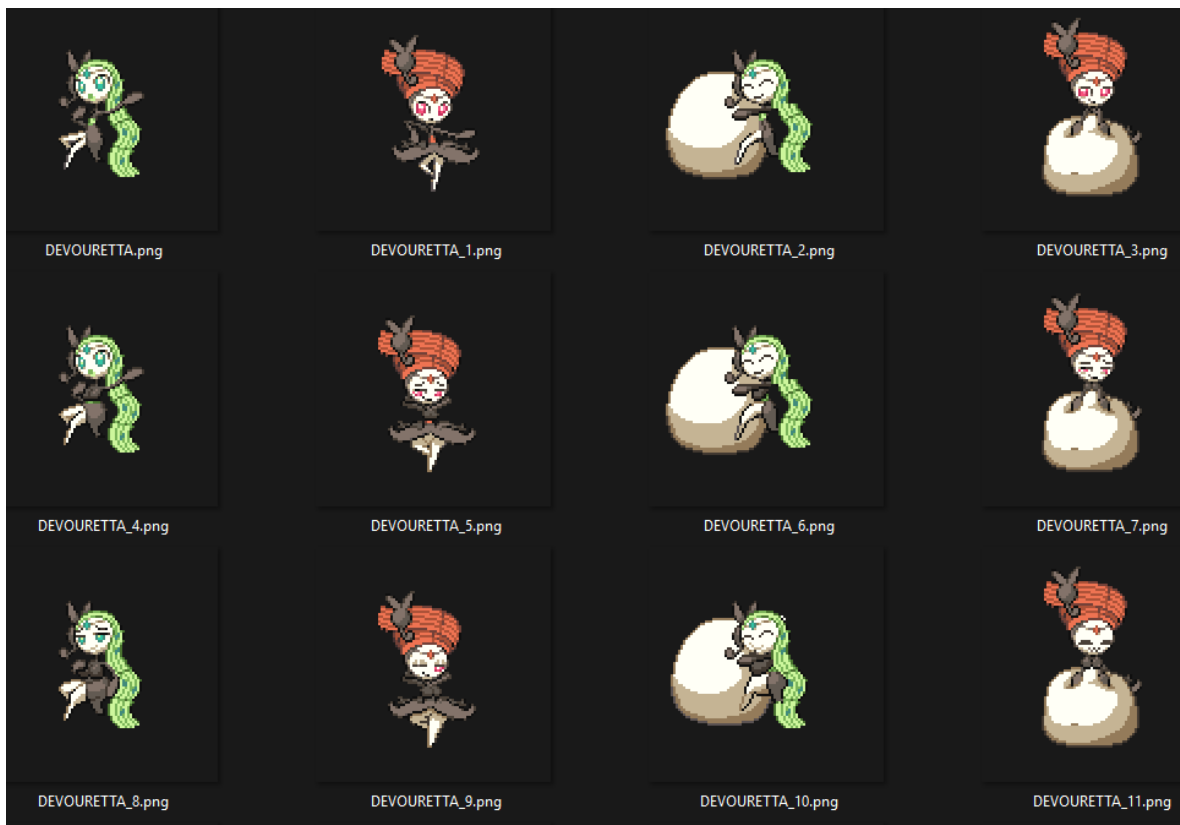

Figure 13. DEVOURRETTA Sprites

Watch out for Pokémon with Megs, or other forms that you do not care about.

For gendered forms, just include the female tag at the end of the image file to separate them. You will fill out the “NumOfForms” as being equal to 1 since the system handles them differently to other alternate forms (see Figure 17).

Figure 14. Example of Wobuffet Gendered sprites

 INDEEVOUR_1.png	1/30/2026 2:03 PM	PNG File
 INDEEVOUR_1_female.png	1/30/2026 2:03 PM	PNG File
 INDEEVOUR_2.png	1/30/2026 2:03 PM	PNG File
 INDEEVOUR_2_female.png	1/30/2026 2:03 PM	PNG File

Multiple Forms

This game allows Pokémons to have multiple forms, but there are some catches. First, the game defaults a lot of alternative forms for existing Pokémon back to the base form after a battle. This will mean that weight after a battle will not stick unless you remove this option or make the pred under a different name to the original (see Figure 15). CAN BE FOUND IN [[Pokemon-related]] => FormHandlers

```
392 MultipleForms.register(:MELOETTA, {  
393   "getFormOnLeavingBattle" => proc { |pkmn, battle, usedInBattle, endBattle|  
394     next 0  
395   }  
396 })
```

Figure 15. Code from FormHandlers handling Multipleforms for Meloetta

In this case, I would make sure that I don't add this to my VOREMELOETTA, so that Meloetta keep forms between battles.

Gameplay Explanation

Max turns and escape chance can be changed in the settings page of the script.

The Devour system makes the predator eat a prey and deal 1/8 hp damage to them each turn

Pokemon with the infatuation status have a 50% chance to massage for the pred instead of damaging them.

You can catch a pokemon that has eaten one of yours, but can't catch a pokemon while they're eaten.

While eaten, a prey has a 20% chance of escaping per turn but must take one turn of digestion damage before the escape is possible.

If they do not break free, they are forced to use the "struggle" move (see Figure 16) located in moves.txt.

If a Pokémon does break free, their pred is forced to spend a turn recovering.

```
[STRUGGLE]
Name = Struggle
Category = Physical
Power = 40
Type = QMARKS
Target = NearOther
FunctionCode = CategoryDependsOnHigherDamageIgnoreTargetAbilityUsableIfEaten
Flags = CannotMetronome
```

Figure 16. Essential move when eaten by a Pred: Struggle

If Endoed, a prey will use struggle to boost their pred's stats each turn, will heal ¼ of hp instead of taking damage, and will have their status effects healed. If the Pred falls asleep while endoing, they will start to digest their pred until they wake up. Will be auto-spit up without a turn recovery penalty for the pred if at full hp.

On Switching out or fainting, a Pokémon will spit out their prey. After digesting a prey, they will gain weight. They will also play an effect on digestion depending on the Vore move used (see Figure 13 for reference):

- a) OV/AV/Tail¹: - Burps up prey's held item if not an important item like a megastone.
- b) UB²: Forms an egg of the unborn Pokémon. The egg retains the shininess of the original eaten Pokémon.
- c) BV³: Receive MooMoo milk.
- d) CV⁴: Sets sticky web on the field.

Figure 17. Gardevore Burping an item after digesting their prey via OV.

¹ OV stands for Oral Vore; AV stands for Anal Vore; Tail stands for Tail Vore.

² UB stands for Unbirth Vore.

³ BV stands for Breast Vore.

⁴ CV stands for Cock Vore

Audio

The system will want sound Effects labelled “BURP_x;” where “x” is an integer (number) starting at 1, located in “Audio/SE” folder. Which will be played when a pred digest a prey completely.

You can include as many of these audio files as you like, and it will play one randomly on digestion (see Figure 18 for example).

ANIMATIONS

The only important animations are Common_Digestion and Common_DigestionOpp, since those will be played during digestion damage. You can use the built in Animation Editor to make your own for moves.

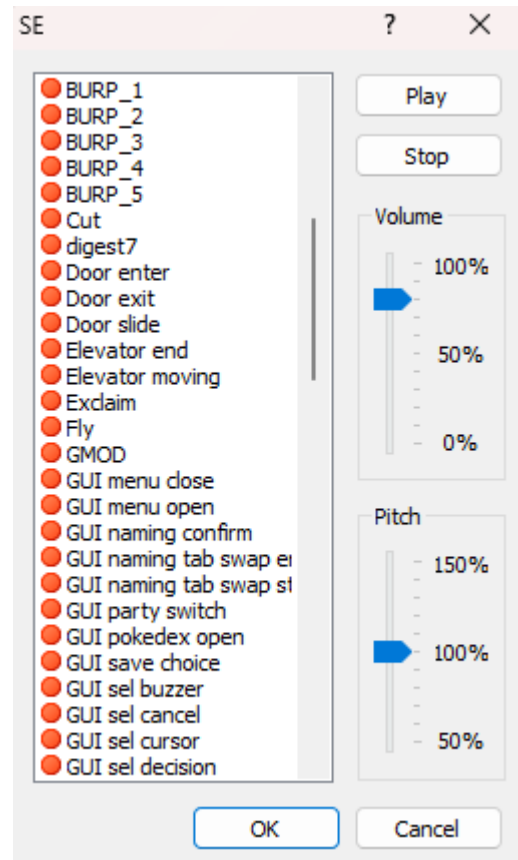

Figure 18. Sample of all available "BURP_x"

Function Code for Moves

For fully unique moves you might need to program your own code. Here are some basic functions you can use:

- A) EatTarget.
- B) EatTargetAnal.
- C) EatTargetTail.
- D) EatTargetUnbirth.
- E) EatTargetBreast.
- F) EatTargetCock.

These all will guarantee Vore on a prey and are best used for low damage/status moves:

- A) EatTargetAdditionalEffect.
- B) EatTargetAnalAdditionalEffect.
- C) EatTargetTailAdditionalEffect.
- D) EatTargetUnbirthAdditionalEffect.
- E) EatTargetBreastAdditionalEffect.
- F) EatTargetCockAdditionalEffect

These will roll a chance to eat the target based on the given effect chance specified when setting up the move.

ALL VORE MOVES

ORAL MOVES

Oral moves are related to eating the prey with your mouth/maw.

1. Devour: The user swallows the target whole, dealing damage and restricting moves. The prey may break out.
2. Role Reversal: Protects the user from attacks. Eats any prey that makes contact.
3. Tempest Inhale: If the opponent switched out this turn, eats the incoming pokemon
4. Viper Strike: The user lunges at the target with venomous fangs and consumes the target
5. Hunt Down: User hunts down their prey, dealing double damage and eating them if they try to escape.
6. Snack Down: Knocks target out of the air with a stone. Flying targets will land in their mouth.
7. Mantis Strike: The User utilizes their speed to catch their prey by surprise. Chance to eat the opponent. Priority move.
8. Ravenous Hunger: The user feels the hunger of the countless predators. Restores Hp with digestion damage.
9. Undertow: Pred disappears under the waves then pulls their prey down the next turn
10. Tongue Snare: Grabs Prey from afar with their tongue. Bypasses protect.
11. Pixie Pounce: The User utilizes their small size to catch their prey by surprise. Priority move.
12. Metro-nom: Uses any random move with which to eat the target.
13. GigaBite: Uses any random move with which to eat the target.
14. Pounce & Pilfer: The user pounces on their prey, eating them and burping up their item to equip.
15. Rampage: The user rampages and eats all in it's path for two to three turns. User is confused after.

BREAST MOVES

Breast moves are related to eating your prey with your breasts.

1. Motorboat: Hits 2 times. chance to consume prey or make them fall in love.
2. Titty Smack: Chance to consume target. X2 damage if User is full.

PUSSY MOVES

Pussy moves are related to eating your prey with your vagina.

1. Containment Protocol: Traps target in user's womb, dealing damage and restricting moves. weakens target's attack stats.
2. Insertion: User thrusts prey into their womb. Unbirth chance based on prey weight.
3. Unbirth: Pulls target into user's womb, dealing damage and restricting moves. The prey may break out.
4. Psysnatch: An unfocused attack that warps the target to unexpected places. May consume the target.

COCK MOVES

Cock moves are related to eating your prey with your cock. user's cock, dealing damage and restricting moves. The prey may break out.

1. Cockslap: The user slaps foe with their hard cock. High critical hit and CV chance.
2. CV: Pulls target into user's cock, dealing damage and restricting moves. The prey may break out.
3. The user whips their cock around. chance to consume prey.

ANAL MOVES

Anal moves are related to eating your prey with your ass.

1. Butt Crush: User Crushes Prey with their ass. Chance to consume them.
2. Ass Drop: User leaps in the air and falls ass first on Prey.
3. Ass Quake: 30% to eat prey. dmg inc. with prey eaten (120 max) User slams their ass down on a prey's head.
4. Pulls prey towards their ass. Chance to consume them.

TAIL MOVES

Tail moves are related to eating your prey with your tail.

1. Tail Strike: The user bites at their prey using their tail.

NON-CONVENTIONAL MOVES

Non-conventional moves are related to eating your prey in non-conventional or exotic ways.

1. Bellyport: The user teleports the target into their stomach. Can't miss.
2. Vanishing Act: The user causes the opponent's Pokémon, and their stats change to disappear.
3. Fatal Embrace: The user lunges at the target to trap them inside their gooey body permanently.
4. Candy Beam: The user turns the target into candy for them to swallow.
5. Soul Eater: The user consumes their prey's soul, defeating them instantly.

PRED MOVES

Pred moves are moves used only when the pred has eaten a prey or has weight to burn off.

1. Clench: The user clenches their abdominal muscles, damaging any prey inside.
2. Jostle: The user shakes their prey around to confuse them. The user must eat a prey to use this move.
3. Belly Slam: Slams their stomach into the target. Double damage if the user has eaten someone.
4. Work off: The user works off their previous meals to boost their stats. Raising their stat to 1; or 2 if they can lose weight.
5. Terastatic Shock: The user charges up power with their fluff to fire off; 1 turn if max weight.
6. Gastric Grave: Move's power increases with each pokemon digested this battle.
7. Hypnotize: Hypnotizes target into wanting to be eaten. Changes their ability to Gutslut.
8. Climax: The user masturbates with their prey, causing infatuation. fails if not CV or UB.

BELCH MOVES

This includes the pre-existing move Belch, as it has gotten a rework.

1. Burp: The user lets out a flinching burp at the target. The user must eat a prey to use this move.
2. Fiery burps: The user lets out a flaming belch at the target with a chance to burn. The user must eat a prey to use this move.

PREY MOVES

Prey moves used for defence from preds or when eaten.

1. Offering: The user tries to feed themselves to a worthy pred.
2. Gut Punch: Doubles 1.5x and causes target to spit out prey if hit by this punch. Cannot use vore moves for 2 turns
3. Writhe: Gains priority and a flinch chance while user is eaten
4. Parasitism: Restores $\frac{1}{2}$ of damage done to target. Can still be used while user is eaten

ESSENTIAL VORE MOVES

Essential Vore moves are special moves used by the mod, removing any of them will crash the game.

1. Struggle: fights inside a pred. Chance to escape from stomach/vagina...
2. Massage: The user struggles lightly to please their pred, sharply raising a random stat by 2.

ENDO MOVES

Endo moves are non-fatal moves; unlike fatal moves that digest and deals damage to Pokémons, Endo moves not only do not deal damage, but heal their prey

1. Safekeeping: Brings target into their stomach to slowly heal them.

ALL FEEDERISM MOVES

Here are listed all moves related to feed your opponent (feederism). For full information go to “FEEDERISM MOVES” in “moves.txt”:

1. Calorie Bomb: The user stuffs food into their opponent's mouth, lowering their speed and attack. Only stuffs preds.
2. Snack Break: The user takes a snack break to recover it's or ally's hp 16% 2-5 times.
3. Stuff – lowers targets attack and speed by 1 and then raises their weight.

ALL REWORKED MOVES

1. Belch: now works on a charge system. Gains a charge after swallowing a prey.
2. BellyDrum: Alongside previous effect also deals a small amount of damage to swallowed prey
3. Swallow: Alongside previous effect also increases max turns trapped of swallowed prey by the user's stockpile countless
4. Spit Up: Swallowed prey count as a stockpile count, also increasing move's max damage. Any eaten prey get spit out on using this move.
5. Self-Destruct/Explosion – can be used while eaten

ALL VORE ABILITIES

Here lies the list of all Vore abilities available in the mod, all the moves are at the bottom of “abilities.txt” and can be added to any pred Pokémon in “Abilities =” from “pokemon.txt” or equivalents (for example “pokemon_base_Gen_9_Pack.txt”).

Alternatively, you can search for a specific ability with their name in “abilities.txt” or in “Battle_AbilityEffects” from Scripts; both using the search function.

1. Apex Pred: Vore move effects have double chance of activating.
2. Armor Burst: User bursts through their armor with weight gain. can eat fire-based moves.
3. Biofuel: Moves first after digesting a prey.
4. Contortionist: Can attack with contact moves while eaten.
5. Cryochamber: Digestion deals with Ice damage with chance to freeze.
6. Glitchy: Gains random stat changes upon digesting prey.
7. Gluttonous: Small amount of Hp recovered per turn if a prey has been digested. Increases with amount of prey eaten in a row (resets on switchout)
8. Gutslut: When targeted by Vore attacks, doesn't struggle. Will use a move called “[Massage](#)” instead. increases odds of encountering a pred in random encounters
9. Haunting: User curses and traps their predator for that turn when digested.
10. Protective: endoed allies take half damage from attacks
11. : Fire/Ice damage reduced at 10% per weight stage of the pred
12. Hibernate: Falls asleep after eating a prey. Prey take double digestion damage.
13. Honey Leak: Produces honey from digested prey.
14. Hunger Drive: Gains increased stats upon digesting an enemy.
15. Huntress: Boosts accuracy of Vore moves.

16. Impervious Gut: Un-effected by the abilities of things it swallows.
17. Infernal Innards: Digestion deals fire damage with chance to burn.
18. Melodic Churn: Secondary effects more likely while digesting prey.
19. Memory Absorb: Can steal the moves of digested prey.
20. Midnight Snacking: Chance to eat a random foe while asleep.
21. Mouthful: Chance to swallow prey with biting moves.
22. Noisy Stomach: Can't hear anything over its own stomach noises.
23. Parting Gift: Burps up bones of prey to use as an entry hazard.
24. Phagocytosis: Can pull prey into their body when hit with contact moves.
25. Poisonous: Poisons Pred when eaten.
26. Reformer: Reforms if digested once per battle. If gen 9 pack not installed, has 33% chance to reform
27. Relentless Storm: Burns some fat each turn to cast a storm.
28. Slow Metabolism: Slower digestion and fall asleep after a meal.
29. Soul Absorb: Absorb the souls of digested prey to recover HP.
30. Stretchy: Prey's struggles are half as effective.
31. Surprise Attack: Catches prey off guard and eats them if it's the first turn of the battle.
32. Tiny Body: Enhanced accuracy but slower digestion.
33. Trick Tum: Releases psychic energy out after digesting prey, twisting the dimensions.
34. Vengeance: Sharply increases attack when eaten.
35. Veteran: While above 1/2 HP, will eat preds that try to eat it.
36. Motherly: Deals Fairy type Digestion damage. 20% infatuate on digest. Speeds up egg hatching
37. Caustic Cauldron: Deals poison type digestion damage. 20% poison on digest.
38. Battery Acid: Deals electric type digestion damage. 20% paralyze on digest.
31. Blistering Belch: Lets out a belch of pure heat after digesting prey, causing harsh sun.
32. Snowy Spittle: Lets out a large burp of snow after digesting prey, causing a snowstorm.
33. Sandy Spittle: Lets out a large burp of sand after digesting prey, causing a sandstorm.
34. Stormy Spittle: Lets out a large wet burp after digesting prey, causing a rain storm.
35. Lady Killer: Digestion deals more damage to female prey.
36. Man Eater: Digestion deals more damage to male prey.
37. FattyFood: Boosts pred's weight up massively and heavily lowers their speed when user is digested.
38. Assimilate: Transforms into their prey after digestion

- 39. Asset Thief: Takes on the typing of a prey it digests.
- 40. Klepto: Burps up and equips items of prey on eating them.
- 41. Self Preservation: Digests an endoed ally to save themself when low hp.
- 42. Clumsy: Chance to trip on a random Pokemon and eat or be eaten by them on a move miss.
- 43. Protein Boost: Burns off weight to increase punching power.
- 44. Burnout: Boosts fire moves 1 time after digestion
- 45. Hungry Glare: Lowers speed of enemies on switch in and after finishing digestion
- 46. Sadist: Raises accuracy and proc chance of vore moves the more the prey's stats have been lowered.
- 47. Hidden Webs: Catches and eats prey that try to use priority moves.
- 48. Gutcha: Eats their pred on being spit up.
- 49. Merciful: Stomach acids cannot faint a prey.

OTHER GOODIES

1. Pokémon loses a weight gain stage every 375 steps, though holding a leftover makes them never lose weight. Pokémon with tiny body or slow metabolism lose weight 1/5 as often. Also, Pokémon with Everstone cannot gain or lose weight. Pokémon with leftovers or black sludge if poison type ignore this.
2. Binding Band half's chance of prey escaping every turn.
3. Losing a fight while the enemy has a pred Pokémon out has that Pokémon eat you in the black out screen.
4. Pokémon can eat berries in battle to move up a weight stage
5. Evolutions based on both the Pokémon's weight and total number of preys digested.

In the pokemon.txt make their evolution either (where x is an integer [number]):

A) Evolutions = EVOLUTIONNAMECAPS, PreyDigested, x

B) Evolutions = EVOLUTIONNAMECAPS, PreyWeightGained, x

Activate when the number is met and a level up occurs.

6. EXPALL is now able to be controlled on or off using the in-game options menu.
7. Preds can have their weights locked by the user. Cannot be increased or decreased until disabled.
8. Added snippet of example code in Battler_ChangeSelf.pbDigestPrey for how to add rewards to a pokemon for digesting certain prey like Arceus.
9. Added simple function code for 2 form transformation pokemon. Eats target and transforms between forms. use function code TransformsUserEatTarget
10. Can feed NPCs to Pokémon using \$player.EatNPC("trainer name") where trainer name is swapped out with a custom name. defaults to "them"
Nineteen would be substituted with the event number of the trainer.
full code

```
eaten = $player.EatNPC("Melissa")
```

```
if eaten
```

```
pbSetSelfSwitch(19, "A", true)
```

```
end
```

11. QoL Digestion damage instant kills the prey if there is a level difference of 20 or more. speeds up farming easy prey. Turned on in player settings
12. If a Pokémon is marked with "Pred" flag you can feed another Pokémon or the player to them. can feed Pokémon in party to another for 2x the exp of beating them. releases the Pokémon. If reformer ability, the prey does not get deleted but pred does not get exp. can be used to quickly get pred to max weight. If you

feed a pokemon with the “Player” flag to them, triggers the vore scene option instead.

13. New icon called icon_pred.png can be placed in Graphics\UI\Battle. Shows if the Pokémon is a pred in the UI. Also works with the included Minimized_UI plugin

Shiny Chaining

Digesting the same type of pokemon over and over without breaking the chain increases odds of finding pokemon of that type as shiny. 1 reroll every pokemon of that species eaten. Resets on finding a shiny of that species or digesting a pokemon of a different species. Needs to be turned on in settings with SHINYVORECHAINS = 1. Putting in a Bgm called ShinyHunt will make that song play after 5 pokemon of the same name are eaten. Goes off the wild pokemon's name to determine species, so having 2 different pokemon with the same name (nidoran male, nidoran female) will increase the shiny chance of both. Does not apply to eggs or pokemon fed to your own team in the party menu.

ITEMS

These items are already programmed into the script and can be added and used

1. PREDBALL – Boosts catch rate on pred pokemon.
2. COTONBERRY – If a prey is holding this berry, causes them to be spit up by their pred.
3. CHOKER – Deals chip damage to prey when swallowed or spit up.
4. BINDING BAND – Already an item, also halves prey's escape chance.
5. RIBBONS - Optional ribbons on 10, 25, 50, and 100 prey eaten. update ribbons.txt file to implement. Don't effect gameplay

SETTINGS

Perma Digestion

All Pokémon without the Reformer ability or Inedible/NoPerma flags will be removed from the game on their digestion and have their poke ball returned to the bag. If you are using the Player as a Pokémon, the digestion of the player will result in a game over. Can be turned on or off in the in-game options menu (see Figure 19).

NOTE: This feature is intended to be used alongside a standard Nuzlocke run for flavor. Players can soft lock themselves if they lose a Pokémon vital for overworld progression and they are unable to catch a new one to continue. This can be avoided by making HMs usable without needing to teach it to a Pokémon or supplying items such as an old rod to the player early and not trapping the player into areas using obstacles like trees, boulders, or rocks with no way to escape.

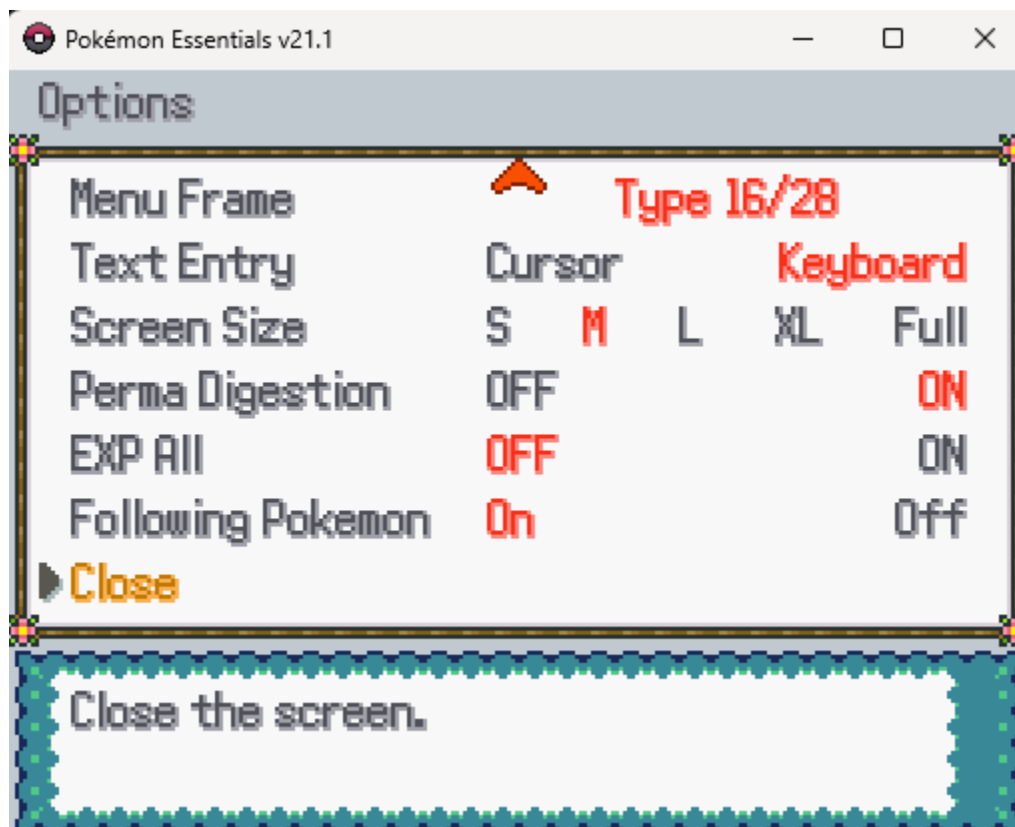

Figure 19. Options In-Game

Settings Toggle

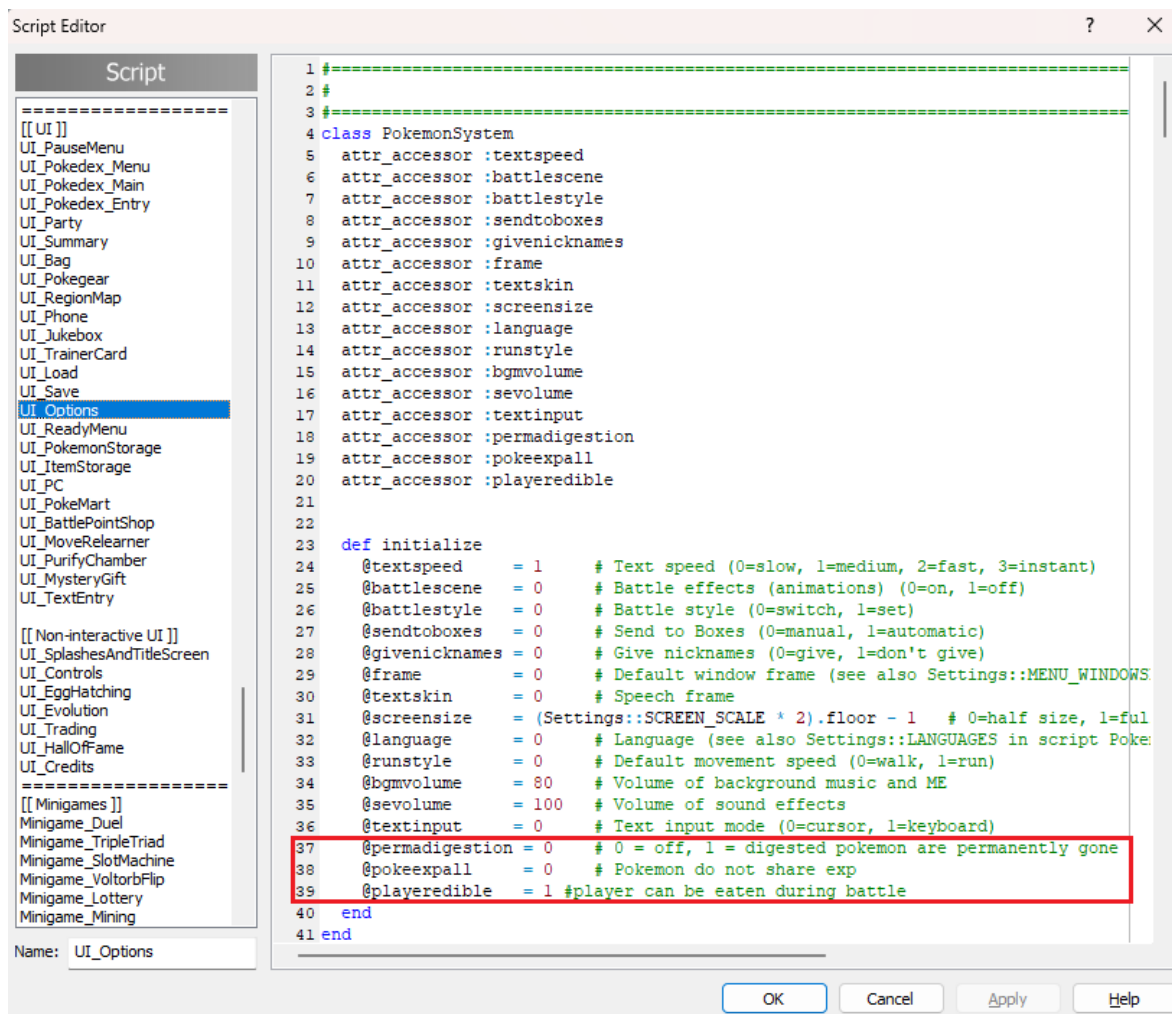

They are located under the Settings tab in the script but can also be changed with events such as `Settings::EXP_ALL_TOGGLE = 0`. The available settings can be found in “Settings;” Line 17 - 23, and are as follow:

P.S: Boolean must be handled as 1 (yes) or 0 (no) rather than “true” or “false”.

SETTING	DESCRIPTION	VARIABLE
PLAYER_IS_POKEMON	Is a player a Pokémon?	Boolean
PERMA_DIGESTION_TOGGLE	Can Player control the Perma-Digestion Toggle?	Boolean
PERMA_ON_LOSABLE_FIGHTS	If a fight is marked as being losable, do their pokemon still get digested?	Boolean
EXP_ALL_TOGGLE	Can player control the EXPALL toggle?	Boolean
PLAYER_WEIGHT_GAIN	Does Player as a pred gain weight?	Boolean
DIGESTION_TURNS	Max turns a Pokémon can stay eaten for	Integer
DIGESTION_BREAKOUT_CHANCE	Chance for a prey to escape early	Integer
SHINYBOOST	QoL way of boosting shiny odds. Use <code>Settings::SHINYBOOST += 1</code> in the script option for events to increase it.	Integer
SCENESONGAMEOVER	Choose if the feed yourself scenes are played on player game over.	Boolean
STEPSFORWEIGHTLOSS	Amount of steps needed before pokemon lose weight	Integer
FOLLOWINGPOKEMONEATINGPARTYCHANCE	Chance for the pokemon at the front of the party to eat and perma another pokemon in the party each weightloss event	integer
SHINYVORECHAINS	Can you use the vore shiny chain method	Boolean

FOR **PLAYER_IS_POKEMON**, **EXP_ALL_TOGGLE**, and **PERMA_DIGESTION_TOGGLE** ONLY

These determine if the player can control their game rules. You can set a rule to be the way you want then disable it from being changed in these settings. These settings **DO NOT** control if the settings are on or off, only if the player can access the toggle. To control these rules themselves, you will need to set the rules to either be off (0) or on (1) in the `UI_Options initialize` method (see Figure 19).

Built in Scene Player

Feed yourself option doesn't appear in party menu if `pokemon_vore_scenes.txt` is not present. Games not planning to use the scene system can now ignore this file completely.

Built in Scene player is a function that allows adding custom Vore scenes without modifying the game's files, those scenes used when offering yourself to your Pokémon. These are all contained in the new `Vore_scenes.txt`

An example of the code is listed below (see Figure 20 for example in-game):

```

#-----
[VOREGLIMMORA]
BGM = Area Zero

```

Visual = Glimmora1

Visual = Glimmora2

Visual = Glimmora3

Visual = Glimmora4

Visual = Glimmora5

Audio = gulp

Audio = digest7

Text = As you ask for {1} to eat you. She makes an expression that could only be described as flustered shock. Seemingly caught off guard by the sudden suggestion. /nextpic But after some encouragement from you. {1} nervously nods and turns around, presenting her ass in front of you. You carefully approach her, giving her reassurance as you kneel down...

Text = /nextpic The heat coming from her ass is almost feverish, the tight ring of muscle glistening in front of you as you carefully begin to push your way in./nextaudio {1}'s breath catches at the sudden intrusion and clenches down hard. Her petals quickly closing up. Sealing you inside of her as you travel deeper...

Text = /nextpic Inside of her is even warmer. The inescapable embrace of her insides hugging you tightly, it's not a long trip and you quickly find yourself stopping in what you can only assume to be her stomach. The chamber is small and closed off, closer to a plant's than anything human. But the sound of {1}'s satisfied cries betrays the organic nature regardless.

Text = /nextpic It takes a couple of hours, but eventually you begin to feel as the walls grow tighter around you. /nextaudio Hugging you closer until your vision starts to darken. You and {1} both give one last synchronized sigh, before you fall asleep and she gets her meal...

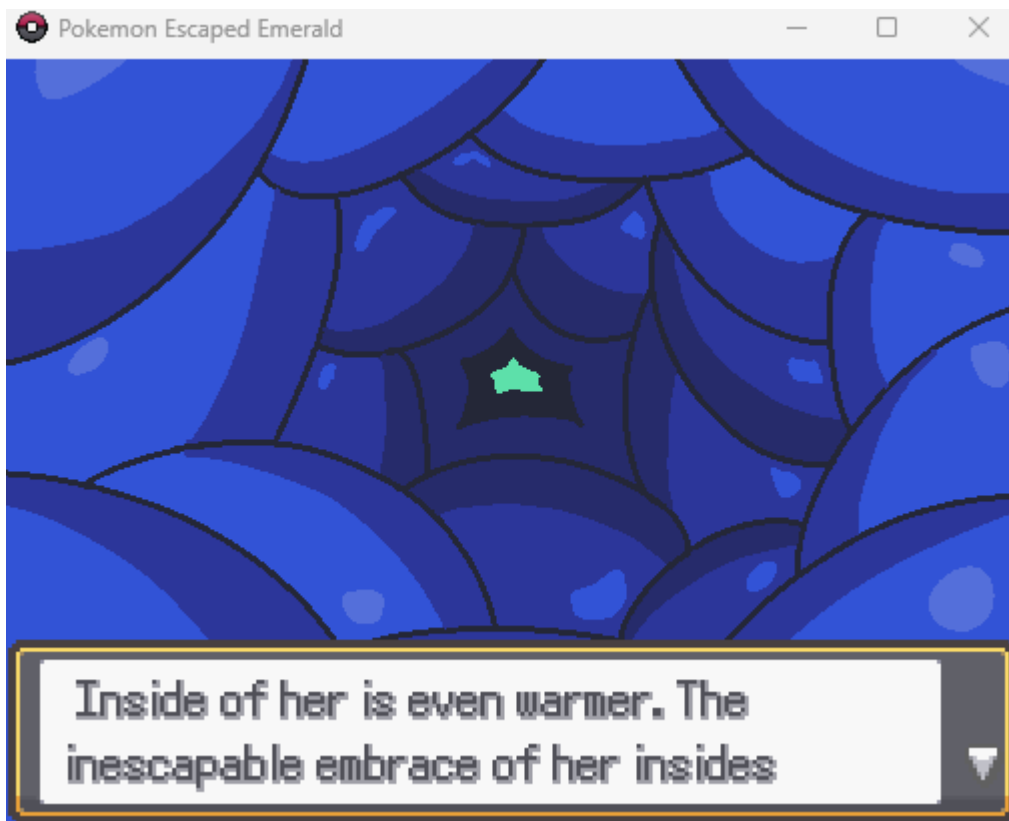

Figure 20. Glimorra Sample Vore Scene

example of how a script would play out. It looks complicated, but it is pretty simple:

#	Command / Text	Description	OPTIONAL?
1	#-----	Must start with the given text	YES
2	[POKEMONNAME]	Pokémon's name with Brackets	YES
3	BGM =	Picks the associated song from the Audio/BGM folder if it exists	NO
4	VISUAL =	Picks the associated image from the Graphics/Pictures folder if it exists	NO
5	AUDIO =	Picks the associated sound from the Audio/SE folder if it exists	NO
6	TEXT =	Displays the given text to the user. Has Escape Sequences (with / and {})	YES
7	INTRO / BODY / ENDING	(DEPRECATED) Same as TEXT.	NO

You can have multiple BGM, visuals, and sound effects. They will play in the order you add them. You can still play the scene without having any BGM, audio, or visuals included, just skip those lines.

Each line starts with **TEXT**. Inside each “TEXT” you can use an Escape Sequence to play or change an image, background music, or sound effect, or to display your Pokémon’s name from the scene. Which are listed as follows:

#	COMMAND	DESCRIPTION	CAN BE USED
1	{1}	Display the Pokémon’s Name	Unlimited
2	/nextpic	Display the next image in “VISUALS”	Once per TEXT line
3	/nextbgm	Plays the next Background Music in “BGM”	Once per TEXT line
4	/nextaudio	Plays the next Sound Effect in “AUDIO”	Once per TEXT line

KEEP IN MIND IT WILL AUTOMATICALLY PLAY THE FIRST PICTURE AND BGM ON STARTING THE SCENE.

The location of the /next text inside a line of text does not matter.

These will mostly be accessed by selecting a pred on the party menu then selecting the feed yourself options. If you turned it on in the Settings script tab, you could also have the scenes play on game over as well.

PLAYER IS PRED

This is a setting that can be enabled if you want the player to be able to battle alongside their pokemon.

1. Players can control if they want to have their mc be able to be eaten or not,
2. Having the "Player" character be eaten in perma-digest mode but game overs turned off, makes you auto lose the battle, but the player character isn't digested.
3. Having the "Player" character be eaten in perma-digest mode and perma game overs on causes an immediate game over.
4. player characters being fed to another pred in the party causes their scenes to play if able.
